Groupe Hospitalier Pitié-Salpêtrière*

1

La ventilation et sa commande

cortex

trunc cérébral
Commande centrale de la ventilation

Contraction phasique des muscles respiratoires

Les structures ACTIVES = Les muscles

Muscles Inspiratoires	Muscles Expiratoires
Sterno-cleido-mastoldiens Scalènes Intercostaux Externes Parasternal Diaphragme	Intercostaux Internes Abdo. Oblique Externe Abdo. Oblique interne Abdo. Transverse Abdo. Grand Droit

Les muscles respiratoires

- Les muscles respiratoires du tronc (diaphragme, scalènes, intercostaux, abdominaux, etc...)
- Les muscles des voies aériennes supérieures

→ Intervention de la commande ventilatoire double commande chez l'homme

Neurones pace-maker

Un milieu pauvre en Ca^{2+} et riche en Mg^{2+} empêche les synapses de fonctionner

Un neurone qui continue de décharger dans un tel milieu est un neurone pace-maker puisqu'il est capable de fonctionner sans recevoir d'information d'autres neurones

Localisation des neurones pace-maker

complexe pré-Bötzinger

(générateur rythmique)

- > position caudale/noyau rétro-facial
- > position ventrale/noyau ambigu
- > en regard de l'émergence des racines du XII

26

Localisation du complexe pré-Bötzinger

Récepteurs exprimés par les neurones du complexe Pré-Bötzinger

neurones identifiables par co-expression à leur surface de **récepteurs aux opioïdes (μ OR)** et de **récepteurs à la substance P (NK1 R)**
il existe aussi des récepteurs au $GABA_B$

Gray et al, 1999

Interactions neuronales inspiratoires et pré-inspiratoires

Interactions des réseaux inspiratoires et pré-inspiratoires

Feldman et al., 2003 35

L'oscillateur parafacial embryonnaire: e-pF

Thoby Brisson et al., 2009

Conservation phylogénétique du patron ventilatoire

Deux types de ventilation

Ventilation Branchiale

Ventilation Pulmonaire

Influences supra-pontiques et corticales

Commandes de la ventilation humaine

➤ une commande automatique
(tronc cérébral)

➤ une commande corticale
(suprapontine et volontaire)

Le cortex cérébral face à une contrainte respiratoire mécanique

- une charge inspiratoire évoque un potentiel EEG précédant l'inspiration

potentiel pré moteur

témoin très probable de l'activation de l'aire motrice supplémentaire

Raux M, J Physiol 2007
Raux M, Anesthesiology 2007

Régulation neurovégétative de la ventilation

Chemosensibilité centrale: réponse au CO₂

Chémorécepteurs Centraux : situés dans le tronc cérébral

Régions chémosensibles du tronc cérébral du rat

Identification par micro-injections acides

- Noyau du tractus solitaire
- Noyau rétro-trapézoïde
- Raphé bulbaire

Identification de neurones chémosensibles

- Bulbe rostro-ventro-latéral
- Locus coeruleus

59

Rôle du Noyau Retro-Trapezoïde : souris mutantes

Syndrome d'ondine

- **Prévalence:** 1 naissance sur 200.000 : maladie rare
- **Génotype:** mutation du gène PHOX2B : expansion d'alanines (5-9 résidus)
- **Phénotypes:**

Réponse au CO₂ chez l'homme

réduction/absence totale de réponse ventilatoire à l'hypercapnie

hypoventilation sévère et mortelle pendant le sommeil

Assistance respiratoire totale par masque ou trachéotomie

Identification des neurones chémosensibles

(Kawai et coll. 1996)

Identification des neurones chémosensibles

Kawai et al, 1996

Réflexe de Hering-Breuer

Les afférences sont véhiculées par le nerf vague (X)

Il est induit par une augmentation de volume pulmonaire (mécanorécepteurs)

Il se traduit par un ralentissement de la fréquence respiratoire : l'inflation pulmonaire prolonge l'expiration

70

Exploration de la Commande Ventilatoire Chez l'Homme

Chaîne de commande de la ventilation

Le spiogramme

$$V_E = V_T \times F = V_T \times \frac{1}{T_{TOT}}$$

$$V_E = \frac{V_T}{T_I} \times \frac{T_I}{T_{TOT}}$$

Le cycle ventilatoire

Tortora et Grabowski aux éditions ERPI

Spiogramme

1 : spiogramme normal

2 : IRCO

3 : commande centrale diminuée

Test au CO₂

Test au CO₂

Test au CO₂

Facteurs influençant la pression d'occlusion - $P_{0.1}$

- Changement de volume télé-expiratoire
- Activation des muscles expiratoires
- Changements de longueur et de vitesse musculaire
- Distorsion de la paroi thoracique
- Forme de l'onde de pression
- Constante de temps du système respiratoire
- Déphasage pression-débit

Tobin et coll. 1994

Synthèse « chaîne » respiratoire
